

# Incident handler's journal

## Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this journal as a way to log the key takeaways about the different cybersecurity tools or concepts you encounter in this course.

<b>Date:</b> July 21, 2025	<b>Entry:</b> 1
<b>Description</b>	Ransomware attack on a small U.S. healthcare clinic caused by a phishing campaign. Critical patient files were encrypted, forcing the clinic to shut down operations. This entry documents the key details and analysis of the incident.
<b>Tool(s) used</b>	<ul style="list-style-type: none"><li>- Email Security Gateway (e.g., Proofpoint, Mimecast)</li><li>- Endpoint Detection and Response (EDR)</li><li>- SIEM platform (e.g., Splunk, Microsoft Sentinel)</li><li>- Threat Intelligence Feeds</li><li>- Incident Response Plan Document</li></ul>
<b>The 5 W's</b>	<p>Who caused the incident?</p> <p>An organized group of unethical hackers known for targeting healthcare and transportation sectors. They gained access via phishing emails.</p> <p>What happened?</p> <p>The attackers sent phishing emails with malicious attachments. When an employee opened the attachment, ransomware was installed and encrypted sensitive files. A ransom note demanding payment appeared on the infected</p>

	<p>systems.</p> <p>When did the incident occur? Tuesday morning at approximately 9:00 a.m.</p> <p>Where did the incident happen? At a small healthcare clinic in the United States. The attack affected the clinic's internal network and employee workstations.</p> <p>Why did the incident happen? Due to successful phishing attacks and lack of endpoint detection or advanced email security. Employees downloaded a malicious attachment, triggering the ransomware.</p>
Additional notes	<ul style="list-style-type: none"><li>- The incident highlights the importance of cybersecurity awareness training, especially regarding phishing threats.</li><li>- It also underscores the need for endpoint protection, regular backups, and strong incident response protocols.</li><li>- The clinic likely had no zero-trust or segmentation in place, allowing lateral movement.</li><li>- Recommend implementation of MFA, secure email gateways, and regular phishing simulations.</li></ul>
